Karin Scholtmeijer. ... Han AB Wösten, in Applied Mycology and Biotechnology, 2005. Filamentous fungi secrete unique proteins called hydrophobins. Upon contact with a hydrophilic-hydrophobic interface these proteins self-assemble into an amphipathic membrane. Differences in the solubility of the assemblages divides hydrophobins into two groups.

Targeted genetic and metabolic engineering of fungi allows production of native and transgenic enzymes and proteins in industrial scales. Those most prominently find application in biorefineries for the production of value-added chemicals and biofuels, in the pharmaceutical industry as well as in biomedicine.

Fungal cyclodepsipeptides (CDPs) are non-ribosomally synthesized peptides produced by a variety of filamentous fungi and are of interest to the pharmaceutical industry due to their anticancer, antimicrobial and anthelmintic bioactivities. However, both chemical synthesis and isolation of CDPs from their natural producers are limited due to high costs and comparatively low yields.

Aspergillus niger is a superior expression host for the ...

Filamentous microorganisms are important work horses in industrial biotechnology and supply enzymes, antibiotics, pharmaceuticals, bulk and fine chemicals. Here we highlight recent findings on the use of microparticles in the cultivation of filamentous bacteria and fungi, with the aim of enabling a more precise control of their morphology towards better production performance.

To overcome the limited availability of antibiotic resistance markers in filamentous fungi, we adapted the FLP/ FRT recombination system from the yeast Saccharomyces cerevisiae for marker recycling. We tested this system in the penicillin producer Penicillium chrysogenum using different experimental approaches.

For these reasons filamentous fungi may often be more appropriate for heterologous SM production. A. oryzae is often used for this purpose because it possesses a limited endogenous secondary metabolism and A. nidulans because a strong genetic toolbox has been developed for this fungus (for review see, Meyer, 2008; Meyer et al., 2011).

For example, in the biotechnology industry, filamentous fungi are used to produce a wide variety of products ranging from human therapeutics (e.g. antibacterial and antifungal agents) to specialty chemicals (e.g. commercial enzymes, organic acids), which together represent billions of dollars in annual sales [1
