Bacterial transformation is a natural process in which cells take up foreign DNA from the environment at a low frequency. After transformation, the cells may express the acquired genetic information, which may serve as a source of genetic diversity and potentially provide benefits to the host (e.g., antibiotic resistance).

Pharmacology is more than the study of the mode of action of drugs. It is a science which uses the basic concepts of biology and chemistry to determine how drugs affect the organism; it gives a unique perspective in understanding how cells, organ systems, and organisms function. Unlike other basic science fields, pharmacology is a special field in which one can systematically investigate the ...

NOTE: Students in specialty majors, cell and molecular biology and microbiology, take the identical courses that biology majors take during the first two years. For the third and fourth years, students in these majors should consult with departmental advisors about the appropriate 3000- and 4000-level biological sciences course requirements for their majors.
