Mechanics of Materials: Calculating Deformations from Loads Deformations measure a structure's response under a load, and calculating that deformation is an important part of mechanics of materials. Deformation calculations come in a wide variety, depending on the type of load that causes the deformation.

These 56 tutorials cover typical material from a second year mechanics of materials course (aka solid mechanics). A solid understanding (pun intended?) of statics and calculus is necessary to properly learn and grasp the concepts of solid mechanics. In order to gain a comprehensive understanding of the subject, you should start at the top and work your way down the list.

Mechanics of Materials 13-3d3 Stress and Strain Example 2 (FEIM): The maximum shear stress is most nearly (A)24 000 kPa (B)33 500 kPa (C)38 400 kPa (D)218 000 kPa Therefore, (C) is correct. In the previous example problem, the radius of Mohr's circle (rmax) was! " $\sigma_{max} = (30000 \text{ kPa})^2 + (24000 \text{ kPa})^2 = 38419 \text{ kPa}$ (38400 kPa)
