Cloning Step 2: The Vector and Ligation Plasmids are circular, extrachromosomal bits of double stranded DNA found in some bacteria.Plasmids use the bacterial cells energy and metabolic pathways to replicate themselves. For a plasmid to be useful as a vector, it should be reasonably small for easy transfer into bacterial cells and be capable of replicating itself in large numbers.

Molecular cloning is a set of methods, which are used to insert recombinant DNA into a vector - a carrier of DNA molecules that will replicate recombinant DNA fragments in host organisms. The DNA fragment, which may be a gene, can be isolated from a prokaryotic or eukaryotic specimen.

Molecular Cloning: Principle, Procedure, and Applications ...

Molecular cloning is a set of experimental methods in molecular biology that are used to assemble recombinant DNA molecules and to direct their replication within host organisms. The use of the word cloning refers to the fact that the method involves the replication of one molecule to produce a population of cells with identical DNA molecules. Molecular cloning generally uses DNA sequences ...

Molecular cloning - Wikipedia

Molecular cloning refers to the process of making multiple molecules. Cloning is commonly used to amplify DNA fragments containing whole genes, but it can also be used to amplify any DNA sequence such as promoters, non-coding sequences and randomly fragmented DNA.It is used in a wide array of biological experiments and practical applications ranging from genetic fingerprinting to large scale ...

Here we describe a straightforward, efficient, and reliable way to clone an insert of choice into a plasmid of choice without restriction endonucleases or T4 DNA ligase. Chimeric primers containing plasmid sequence at the 5' ends and insert sequence at the 3' ends were used to PCR-amplify insertion sequences of various sizes, namely the genes for GFP (gfp), β -d-glucuronidase (gusA), and ...

INTRODUCTION. Twenty-five years ago, the concept of using Agrobacterium tumefaciens as a vector to create transgenic plants was viewed as a prospect and a "wish." Today, many agronomically and horticulturally important species are routinely transformed using this bacterium, and the list of species that is susceptible to Agrobacterium-mediated transformation seems to grow daily.

The cellular processes that benefit from sleep and the mechanisms driving sleep regulation remain unclear. Zada et al. report that buildup of DNA damage in neurons during wakefulness increases sleep pressure. Parp1 senses DNA damage and promotes sleep, which facilitates efficient DNA repair and reduction of the cellular homeostatic pressure.
